

Figure 5 (to FER-164). Plot of seismicity in the southern Hollister study area for the period 1969-1984. Quality of epicenter locations is A and B (U.S.G.S., 1985). Most of the seismicity associated with the San Andreas fault has not been plotted due to the extreme density of epicenters in the $M \geq 1.0$ range. Faults are generalized from Buchanan-Banks, et al. (1978) and Dibblee and Rogers (1975). Scale of map is 1:250,000.
